Travertine is a sedimentary rock that began as limestone. The porous nature of limestone makes it a great reservoir for liquids. Heated by the Earth’s inner core, water rises as steam or hot mud baths, such as geysers. This hot liquid dissolves the limestone and rises to the Earth’s surface forming mud beds. After enough time passes, the mud bed cools and crystallizes to form a solid stone called travertine.

The characteristic small holes or cavities found in travertine are a result of the cooling process. Sometimes those holes are filled before the product is honed or polished. Fill material is generally material dust from the cutting process and mixed with a hardener. Unfilled Travertine is quite beautiful and unique. Travertine is harder than limestone, but softer than marble or granite.

### Travertine Finishes

- **Honed:** Smooth, non-reflective finish (matte)
- **Polished:** Non-chemical finish that reflects light and gives appearance of depth
- **Tumbled:** Rounded edges and corners for a rustic look
- **Brushed:** Steel brushes are used to create a textured look
- **Chiseled:** Edges are mechanically chipped to create an aged appearance
**Variation in color, veining and shading are inherent from one piece to another. Photo reproductions may not match the exact color of tile.**
